Scheduler
BKV regional
buy
Sell
Grid Energy

BUSINESS MODEL

Customer Segments

- BKV Regional
- Companies with electric vehicles with bidrectional charging

Value Propositions

- Giving stability to the BKV
- Giving a cheaper option for BKV rather than to the generator
- Getting more revenues/profits for EV vehickles → incentivize more EV use

Customer Relationships

- EV Companies to BKV : Taking the electricity when the price is high
- BKV to companies : Selling for a cheaper price when excess energy and taking energy when it needs more energy

Channels

- Giving stability to the BKV
- Giving a cheaper option for BKV rather than to the generator
- Getting more revenues/profits for EV vehickles → incentivize more EV use

Revenue Streams

- BKV: Incentive
- EV Vehicles incentives (SAAS fee per month 15 euros/ vehicle)
- White label reporting

Key Resources

- Platform Development: (Predicition Models for maintenance)
- 8% grid profit

Key Activities

- Go to market:
- Platform development
- Finance calculations

Cost Structure

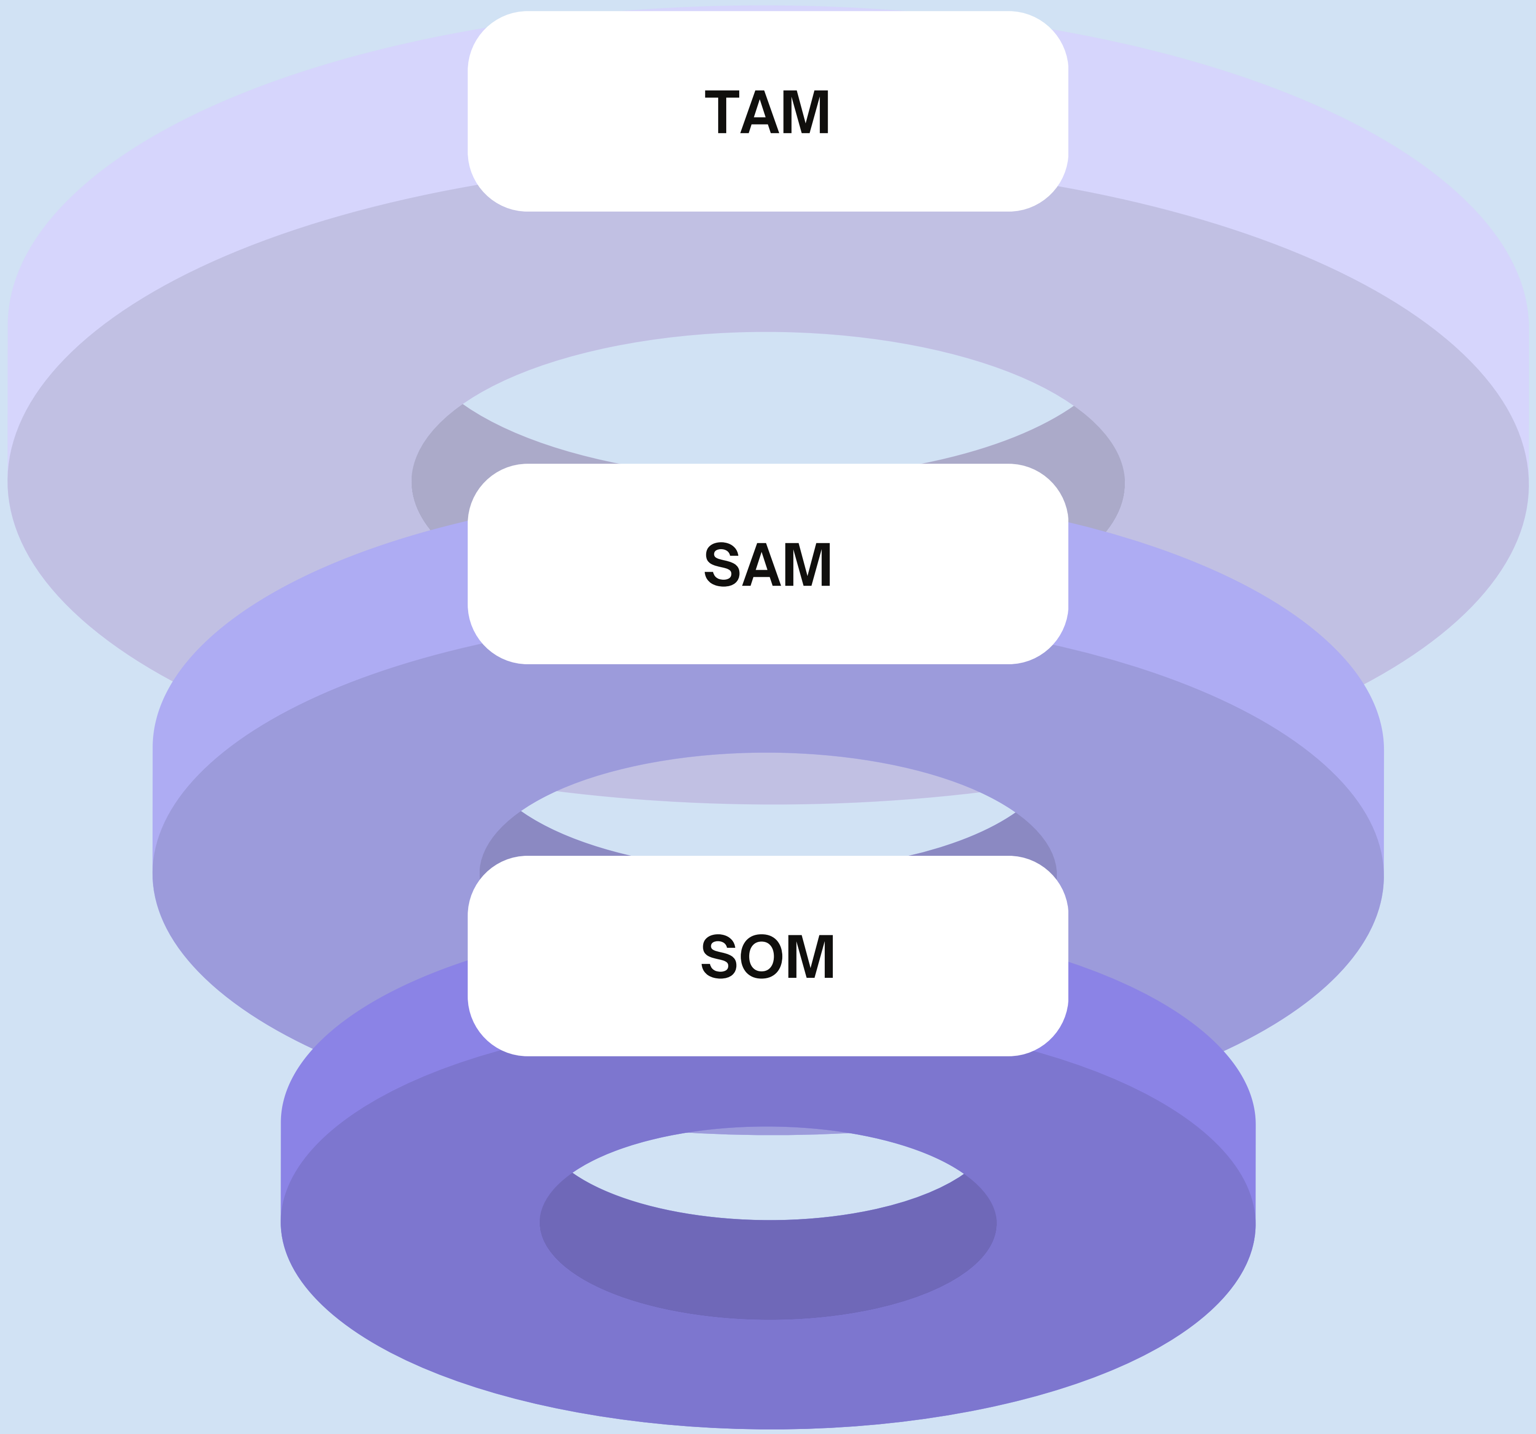
- Development of Platform
-

REGIONAL CHOOSING

Mercedes-Benz

- Baden Wuttemberg
- 30-50% High demand at night from big companies (Mercedes, Daimler)
- High bidirectional EV supply (circa 323,000 EVs)

FINANCIALS



Globall V2G Market 47 B

EU + UK Fleet 8.2B B

Target 5% EU Fleet Y5 340 M

RESTRICTIONS

- Open regulatory risks (pay network charges on reverse power flow (§ 19 StromNEV), the exact tax and VAT status of V2G income)
- The 1 MW Minimum Lot Size
- The BKV Partnership Requirement
- Hardware Constraints and Software Locks → Can only be bidirectional vehicles
- Battery Degradation This is the most critical financial constraint for your hackathon pitch: every charge and discharge cycle degrades a battery. Daily V2G use adds approximately 1.8% extra capacity loss per year to the battery. A credible product must mathematically prove that the market revenue you generate safely exceeds this physical degradation cost; a service that earns less than it costs in battery wear is not viable

PARTNERSHIP MIT BKV

- Open regulatory risks (pay network charges on reverse power flow (§ 19 StromNEV), the exact tax and VAT status of V2G income)
- The 1 MW Minimum Lot Size
- The BKV Partnership Requirement
- Hardware Constraints and Software Locks → Can only be bidirectional vehicles
- Battery Degradation This is the most critical financial constraint for your hackathon pitch: every charge and discharge cycle degrades a battery. Daily V2G use adds approximately 1.8% extra capacity loss per year to the battery. A credible product must mathematically prove that the market revenue you generate safely exceeds this physical degradation cost; a service that earns less than it costs in battery wear is not viable

REGULATORIES OF BKV

- Open regulatory risks (pay network charges on reverse power flow (§ 19 StromNEV), the exact tax and VAT status of V2G income)
- The 1 MW Minimum Lot Size
- The BKV Partnership Requirement
- Hardware Constraints and Software Locks → Can only be bidirectional vehicles
- Battery Degradation This is the most critical financial constraint for your hackathon pitch: every charge and discharge cycle degrades a battery. Daily V2G use adds approximately 1.8% extra capacity loss per year to the battery. A credible product must mathematically prove that the market revenue you generate safely exceeds this physical degradation cost; a service that earns less than it costs in battery wear is not viable

REVENUE

- Energy Payments: If you bid into the aFRR or mFRR markets, you receive availability payments plus an additional payment for the actual megawatt-hours (MWh) of electricity you discharge when the grid instructs you t
- Availability Payments: If you bid into the fast-responding FCR market, you are paid per Megawatt, per week, just for having the vehicles plugged in and ready to automatically respond within 30 second
